

Tooth transitions and observed H→C events (996 transitions, 83 events, 81 children)

(a) Primary dentition: transitions and events

(b) Observed events in source coordinates

Circle area $\propto$ eligible transitions (max $n = 122$). Fill = observed H→C fraction.
Tooth labels: transitions / events. Heavy red outline: ≥ 1 observed event.
All 83 events occurred in molars; zero observed events do not establish zero risk.
